A special issue of Nucleic Acids Research now available separately as a soft-bound book

The Applications of Computers to Research on Nucleic Acids

Edited by Dieter Söll and Richard J. Roberts

This unique collection of 38 papers focuses on the use of computers to store and analyse nucleic acids sequence data. The programs described range from straightforward algorithms based on simple search routines to some highly sophisticated packages for data base management and analysis. The book will help you to discover whether a program which might be implemented on your particular machine already exists.

A useful starting point for anyone newly discovering a need for such programs and stimulating for those deeply involved to exchange or improve existing programs.
