The Applications of Computers to Research on Nucleic Acids I

Edited by D.Söll and R.J.Roberts

The first volume of papers on this topic was published in January 1982. An essential companion to the second volume, this book contains additional programs used in laboratories for the handling of nucleic acid sequence information. The book not only serves as a practical guide for those intending to establish a computerised system for nucleic acid sequence information but also as an

“... excellent reference source ...” **Biotechnology, 1983.**

Some sample contents...

Computer programs for nucleic acid sequence manipulation

R.M.Blumenthal, P.J.Rice and R.J.Roberts • Los Alamos sequence analysis

package for nucleic acids and proteins *M.I.Kanehisa* • Efficient algorithms

for folding and comparing nucleic acid sequences *J-P. Dumas and*

J.Ninio • Computer-aided prediction of RNA secondary structures

P.E.Auron, W.P.Rindone, C.P.H.Vary, J.J.Celentano and J.N.Vournakis

• Improvements to a program for DNA analysis: a procedure to find homologies among many sequences *C.Queen, M.N.Wegman and L.J.Korn.*

(Originally published as Volume 10 No.1 of **Nucleic Acids Research** and issued to subscribers in January 1982).
